

## Laser Collagen Synthesis

*980nm Diode Laser*

*Before*

*After*

One of the more advanced procedures now available in a medical aesthetics practice is the use of specific laser energy to create a heat reaction to fracture collagen, stimulating the growth of new collagen to provide a dramatic anti-aging effect. A series of collagen synthesis treatments can provide up to a 25 times increase in collagen production.

In comparison to dermal filler treatments, laser collagen synthesis is designed to stimulate the natural growth of collagen rather than injecting and implanting temporary fillers.

Laser Collagen synthesis may require a cycle of multiple treatment sessions, often twice monthly, for optimal results. This procedure can be combined with radio frequency skin tightening treatments for a more dramatic overall improvement.
